

Lung Cancer treatment demo –

Part 2

As continuing from Part 1, after a patient is detected with the outcome (benign, malicious, etc.), using NLP and Scraping, develop project to print out a patient's report to assist doctors for treatment (recommendation).

As the status of the patient, the script can go to (for example) <https://www.cancer.org/cancer/small-cell-lung-cancer/treating/by-stage.html> to scrape the treatment text and then summarize it in a smaller paragraph (doctors do not have time to read the whole text).

The report should include:

1. Stage of the cancer (of patient).
2. Summary of Treatment Recommendation.
3. Recommendation for Medicine (name) use.
